Optics-1000 Phenol (C₆H₆O)

Method Colorimetric

After adding the sample into the measurement cell, some reagents are added in order to adjust the solution to the desired conditions (pH, valence's elements, etc.). Then, a blank is done to correct any temperature or turbidity disturbance. Subsequently, a last reagent is added, and it reacts with solution developing a color, which is measured using a correct wavelength. Thanks to the photometer used, the result achieves a great accuracy.

Principle of measurement

The method relies upon the reaction of the phenol with 4-aminoantipyrine followed by oxidation of the adduct with persulfate to form a pink complex.

Advantages of the method

The method is specific for phenol and all non-4-substituted monohydric phenols. The method is also very sensitive and levels as low as 0 to 100 ppb may be measured using the correct circumstances.
